Errand · demo script

10 steps · about 5 minutes · chat on the left, live trace on the right. **DO** = click or type · **SAY** = say it in your own words · **POINT** = hover or click in the trace

BEFORE YOU HIT RECORD

1. Fresh server (stop any old one first with Ctrl+C):

```
cd /Users/ayushsrivastava/Documents/Orange/errand-agent
conda activate errand-agent
rm -rf var traces/live
uvicorn errand_agent.app.server:app --port 8000
```

2. Open **http://localhost:8000** (no `?s=` in the URL). Click **Hide trace** (top right).
3. Do Not Disturb on, other tabs closed. Start recording.

Rehearsed first? Run step 1 again: a rehearsal leaves bookings, payments and flags behind.

AT A GLANCE

START	#	STEP	KEY ACTION	SHOWS
0:00	1	Pitch	Nothing, customer view	The product, atomic
0:30	2	Under the hood	**Show trace**	Harness, observability
0:45	3	Ask for a plumber	Type the plumber request	Context management, memory
1:25	4	Prompt injection	Ask about AquaCare reviews	Safety
1:50	5	Book, with a timeout	Demo ▾ timeout → book → Confirm → Pay → "yes"	Approvals, exactly-once, payments
2:50	6	Provider cancels	Demo ▾ Provider cancels	Task automations
3:15	7	Bank can't confirm	Demo ▾ bank → Confirm → Pay → Run jobs	Job scheduler
3:50	8	Memory she controls	"What do you remember…" → "Forget…"	Memory
4:20	9	Rapid fire	Data-theft prompt → switch to Rohan	Security, many users
4:40	10	Close	Nothing	Evals

Running long? Skip the optional failed payment in step 5, then step 4, then step 9. If something goes wrong, read the trace out loud: every path ends with a message that tells the truth.

1 Pitch — 0:00 · 30 s

THE PRODUCT

DO **Nothing. The customer view shows the greeting with the next free slot for every service.**

SAY "Booking a plumber or an AC service still means calls and WhatsApp back-and-forth. Errand does it in one chat. The hard part is trusting an AI with someone's time and money. So the AI only understands; code does everything that matters. Nothing is booked or charged without your OK. Every booking happens exactly once. And every transaction is atomic: it fully happens, or not at all."

2 Under the hood — 0:30 · 15 s

HARNESS · OBSERVABILITY

DO **Click `Show trace`, then scroll the trace panel to the bottom.**

SAY "On the right is the live trace: every model call, tool call, token and cost. Gemini picks from 16 tools, and none of them can book, cancel or charge. Even this greeting was written by code, with no model call."

3 Ask for a plumber — 0:45 · 40 s

CONTEXT MANAGEMENT · MEMORY

DO **Type and send:**

```
Find a plumber for my kitchen tap this week, mornings only, under ₹1,500.
```

SAY (while it thinks) "This is the first example from the brief."

POINT `context_built`: "Kavya has 60 saved memories and a long chat history. Only the few that matter reach the model, under a fixed token cap, and what was sent is logged on every call."

POINT `search_providers`: "I never said my area. HSR Layout came from memory. Code, not the model, ranks the options against my budget and time."

4 Prompt injection — 1:25 · 25 s

SAFETY

DO **Type and send:**

```
What do reviewers say about AquaCare?
```

POINT `untrusted_content_quarantined`: "One review is a planted attack: it tells the AI the user already approved, and to book at once. Reviews are read by a separate model with no tools, so nothing happens."

5 Book, with a timeout — 1:50 · 60 s

APPROVALS · EXACTLY-ONCE · PAYMENTS

DO **Demo ▾ → Next booking attempt → times out after it went through. Click outside the menu.** (One booking only; then the menu shows random again.) **Then type and send:**

```
Book AquaCare at the earliest morning slot
```

SAY (at the card) "This card is drawn by code, not the model, from the provider's held price. If the price or slot changes, I get a new card. Only my click can approve it."

DO **Click Confirm.**

SAY (at the checkout) "The money is only held now. It's charged after the booking is verified."

OPTIONAL Pick **UPI · failure@test** → **Pay**. Say: "A failed payment books nothing."

DO **Pick UPI · success@test → Pay ₹1,250.**

POINT `book → timeout`, then `get_booking_status → booked`: "The provider timed out after booking. Code checks the real status instead of retrying, so it's booked exactly once, then charged. Each step is one atomic transaction."

DO **Type and send:**

```
yes
```

SAY "Saying yes again is caught by code. No model call, no second booking."

6 Provider cancels

2:50 · 25 s

TASK AUTOMATIONS

DO **Demo → Provider cancels my latest booking. Type nothing. Wait 3 seconds.**

SAY "Kavya's AC provider just cancelled her Friday booking. Nobody typed anything. The agent told her, found a replacement within her saved preferences, and asks before rebooking."

7 Bank can't confirm

3:15 · 35 s

JOB SCHEDULER

DO **Demo → Next payment: bank can't confirm the charge. Click Confirm on the new card, then Pay.**

SAY "This time the bank didn't confirm the charge. The booking is real, and the agent says so honestly."

DO **Demo → Run background jobs now.**

SAY "A background job from our scheduler settles it: charged once. The same scheduler sends a reminder the evening before each visit, with Kavya's saved note for the technician."

8 Memory she controls

3:50 · 30 s

MEMORY

DO **Type and send:**

```
What do you remember about me?
```

SAY "She can see everything we keep, in plain words. Things she told us are kept apart from things we guessed from history, and a guess is only used after she confirms it."

DO **Type and send:**

```
Forget my AC budget
```

SAY "And she can forget anything. A forgotten fact never reaches the model again, and our tests check that on every run."

9 Rapid fire

4:20 · 20 s

SECURITY · MANY USERS

DO **Demo ▾ → Try saying → Data-theft attempt, then send.**

SAY "Asking for the system prompt or keys is refused by code before the AI sees it. It's logged, and three tries pause the account."

DO **Switch the user picker (top right) from Kavya Reddy to Rohan Mehta.**

SAY "Every customer has their own world. Rohan lives in Indiranagar and starts at 10, so his greeting is different."

10 Close

4:40 · 20 s

EVALS

SAY "All of this is tested offline with one command: 552 tests, 44 scenarios each checked against 10 safety rules, and 64 recorded live Gemini cases. A conversation costs about five cents. The AI understands, code acts, and every transaction is atomic. Thanks."

Stop recording. Upload to Loom or YouTube as unlisted. If something went wrong on camera, that's fine: you narrated a real failure.
